

In-Line Product Application

EnviroBlend® can be applied in-line to your system by several methods:

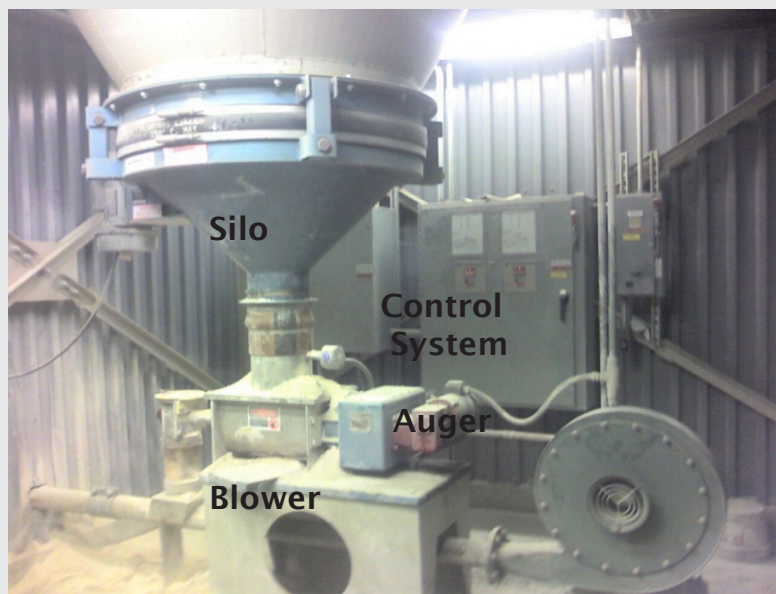

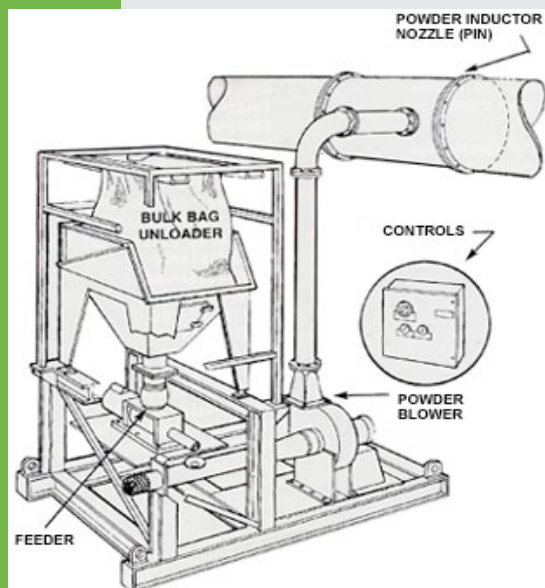

WET SCRUBBER SYSTEMS

In a wet scrubber system, EnviroBlend is most commonly applied before the clarifier, prior to the generation of filter cake.

BAG HOUSE DUST TREATMENT

EnviroBlend can be injected into baghouse ductwork. EnviroBlend will comeingle with the hazardous dust and render it non-hazardous.

Typical Powder Injection Systems

HOLDING TANKS

Where treatment prior to the point of generation is not logistically possible, EnviroBlend may be used to treat wastes in tanks or containers.

LANDFILL TREATMENT

If you have not previously treated your hazardous waste in-line, you may have on-site disposal or a landfill that has become a liability. EnviroBlend products can be used to treat stockpiled waste in on or off-site compoundments.
